Hiring Committee

Hiring Team

Optum – UnitedHealth Group

Richmond, BC (Remote)

I'm excited to apply for the Associate Software Engineer position at Optum. I am deeply aligned with Optum's mission to reduce healthcare barriers through equitable, technology-aided care.

I recently completed a Master's in Applied Modelling (Financial Analytics) at Trent University, where I built a strong foundation in algorithms, data structures, and data-driven problem solving. That background complements my hands-on engineering experience shipping web applications with React, TypeScript/JavaScript, and Node.js, and designing APIs that integrate multiple services cleanly and securely.

My experience includes building scalable and secure web applications using React, TypeScript, Node.js, and PostgreSQL. I have worked on projects where I designed modular frontends and backend microservices, enabling seamless data flow and real-time responsiveness and developed the ability to analyze large datasets, optimize system performance, and design data-driven solutions

My personal projects showcase a document management system using a microservices architecture with Node.js, PostgreSQL, JWT authentication, and containerized services using Docker. The system emphasized clean API design, modular structure, and fault-tolerant service interactions, aligning with Optum's focus on building reliable, orchestrated systems behind AI agents. I also developed a content summarization web app using React and integrated Open AI's API to transform lengthy inputs into actionable insights, improving user engagement and task completion speed. These experiences strengthened my skills in RESTful API development, latency-aware UI flows, and building robust user-facing services that reduce friction, matching the needs of a team building conversational, self-serve customer support experiences.

Across these projects I've gotten comfortable navigating large codebases, reviewing peers' changes, writing well-tested components, and balancing speed vs. safety, shipping incrementally while protecting systems from regressions. I thrive in teams that communicate openly about risks and trade-offs, and I actively seek feedback to accelerate my growth.

I'd be thrilled to further discuss how I can help Optum deliver better outcomes through software. Thank you for considering my application.

Warm regards,
Kareem Alameen.
